
CAMPUS MASTER PLAN

50 Colleges, 3 Central Nodes, 6 Continents

NOT BUILT. FOUND. REPURPOSED. PERMANENT.

THE ARTEMIS CAMPUS CONCEPT

Repurposed buildings become permanent Colleges. Image: Unsplash

The University of Artemis does not build campuses. It finds existing buildings and gives them a second life as Colleges. Repurposed convents, warehouses, offices, factories — each one acquired, not leased; owned, not rented; permanent, not temporary. This approach eliminates approximately 80% of the capital costs associated with traditional campus construction while creating Colleges that are embedded in the fabric of their cities, not isolated on suburban campuses. The Artemis campus is not a single location — it is a distributed network of 50 Colleges across 35 countries, connected by a synchronous global campus that makes geography irrelevant to the quality of education.

THE THREE CENTRAL NODES

VENICE CENTRAL NODE

The Venice Central Node is the governance headquarters of the University of Artemis. Located in the historic city that has been a crossroads of civilisations for over a millennium, the Venice Node houses the founding document, the office of the President, and the primary meeting space for the Board of Trustees. The building is a repurposed palazzo on the Grand Canal, combining 15th-century architecture with 21st-century technology. The Node serves approximately 5,000 students and is the European hub for the Artemis network, with responsibility for operations in Europe, the Middle East, and Africa. Venice was chosen because it embodies the university's values: a city built on trade and exchange, where diverse cultures have met and produced extraordinary civilisational achievements for centuries.

SAN FRANCISCO CENTRAL NODE

The San Francisco Central Node is the innovation and technology hub of the University of Artemis. Located in the city that has defined the digital age, the San Francisco Node houses the Global Challenge Fund, the digital infrastructure team, and the innovation labs that bridge scholarship and the world it serves. The building is a repurposed warehouse in the SoMa district, combining industrial architecture with cutting-edge technology. The Node serves approximately 5,000 students and is the Americas hub, with responsibility for operations in North and South America. San Francisco was chosen because it represents the intersection of technology, innovation, and social change — the same intersection at which Artemis operates.

SINGAPORE CENTRAL NODE

The Singapore Central Node is the admissions and research gateway for Asia-Pacific. Located in the city-state that has become the world's most successful model of multicultural meritocracy, the Singapore Node houses the central admissions office, the Asia-Pacific research coordination centre, and the digital campus infrastructure. The building is a repurposed shophouse complex in the Civic District, combining colonial-era architecture with modern functionality. The Node serves approximately 5,000 students and is the Asia-Pacific hub, with responsibility for operations in East Asia, South Asia, and Oceania. Singapore was chosen because it demonstrates that excellence is not dependent on size — a city-state of 5.5 million people has become one of the world's leading knowledge economies.

COLLEGE TIERS

Colleges are organised into three tiers based on location, size, and regional role. Tier A Colleges are located in the world's great knowledge capitals and serve approximately 2,500 students. Tier B Colleges are in major global cities and serve approximately 2,000 students. Tier C Colleges are in emerging knowledge centres and serve approximately 1,100 students. All Colleges, regardless of tier, offer the same tutorial-based education, the same curriculum, and the same degree. The tier system reflects the economic reality of different property markets — a College in central London costs more to acquire than a College in Kigali — but it does not reflect a difference in educational quality. Every Artemis College is a world-class institution.

Tier	Students	Properties	Acquisition Cost	Example Cities
Central Node	~5,000	3	Varies	Venice, San Francisco, Singapore
Tier A	~2,500	10	\$3-5M	London, Paris, Tokyo, Berlin, Nairobi
Tier B	~2,000	15	\$1.5-3M	Lagos, Mumbai, Mexico City, Istanbul
Tier C	~1,100	22	\$0.5-1.5M	Kigali, Dhaka, Kampala, Karachi

REPURPOSING PHILOSOPHY

Modern adaptive reuse: existing buildings become world-class educational spaces. Image: Unsplash

The repurposing approach is not just a cost-saving measure — it is a philosophical commitment. Great universities have always been embedded in great cities, not isolated on suburban campuses. The College of the University of Chicago is woven into the city's Hyde Park neighbourhood. The Sorbonne sits in the Latin Quarter. LSE occupies buildings along the Aldwych. Artemis Colleges follow this tradition: they are part of the city, not apart from it. Students live in the neighbourhood, eat at local restaurants, and contribute to the local economy. The College is a permanent institutional presence that benefits both the university and the community. Repurposing also means that each College has architectural character and historical significance that new construction cannot replicate. A repurposed convent in Venice is not just a building — it is a statement about the relationship between past and future, between preservation and innovation.
